

CHALLENGES

- Aggregate data from different sources and locations
- 

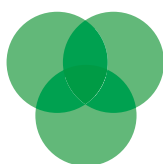

Gathering data from various sources — each with its own format and requiring distinct data pipelines — can be challenging. Meeting these demands often involves significant manual effort, all while ensuring that data flows are as secure as possible.

- Transform data into actionable insights
- 

A large amount of data doesn't necessarily translate into useful information. Regional particularities must be reconciled with global indicators. Complex, time-consuming dashboards often require extensive human processing and frequently fail to clearly indicate what actions need to be taken.

SOLUTION Vision

Healthcare expertise

Automations

Artificial Intelligence

- ✓ Automatic data ingestion pipelines.
- ✓ Data sanitization and standardization.
- ✓ Actionable insights extracted through AI.

USE CASE

- Brazil is a country with 212 million inhabitants, 26 states, and a wide range of geographical and epidemiological characteristics.

At Lean Saúde, we leverage automated data pipelines to ingest millions of data points daily from various health insurance providers.

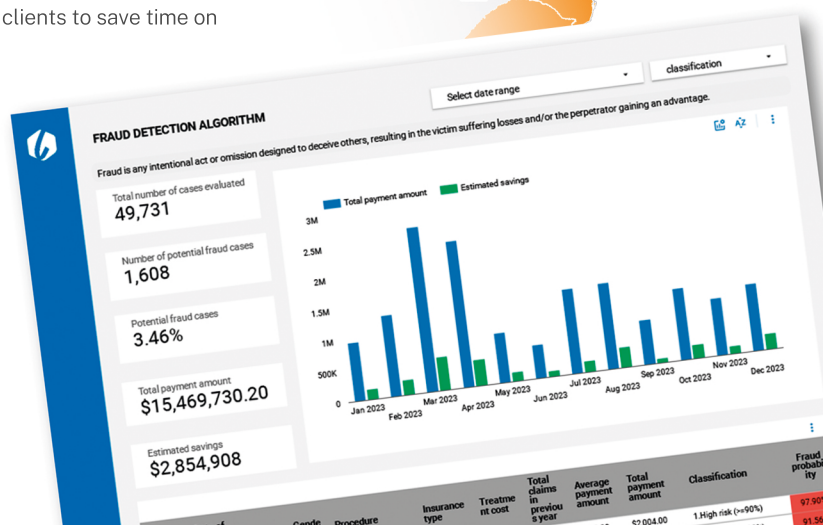

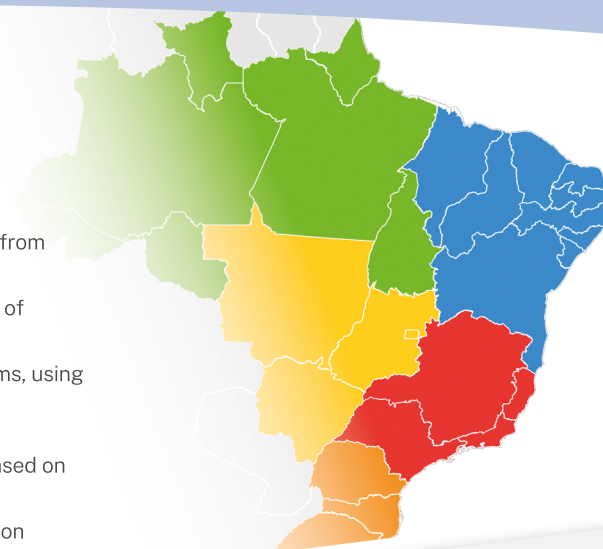

These data are validated, sanitized, structured, and securely stored across redundant layers of cloud-based repositories.

We calculate risk profiles and identify priority groups for a wide range of healthcare programs, using proprietary AI algorithms and other advanced technologies.

Raw data is effectively transformed into actionable insights and delivered through clean, user-friendly dashboards, as well as AI-powered prompts that answer complex questions based on the processed information.

Additionally, we automatically generate executive reports, enabling our clients to save time on preparing presentations and conducting in-depth analyses.

- As a result, Lean Vision drives overall efficiency by reducing time spent on manual tasks, clarifying complex data, and identifying key opportunities for action — ultimately leading to better management outcomes.
